

Assignment Questions 6

💡 Question 1

A permutation perm of $n + 1$ integers of all the integers in the range $[0, n]$ can be represented as a string s of length n where:

- $s[i] == 'I'$ if $perm[i] < perm[i + 1]$, and
- $s[i] == 'D'$ if $perm[i] > perm[i + 1]$.

Given a string s , reconstruct the permutation perm and return it. If there are multiple valid permutations perm, return **any of them**.

Example 1:

Input: $s = "IDID"$

Output:

$[0,4,1,3,2]$

💡 Question 2

You are given an $m \times n$ integer matrix matrix with the following two properties:

- Each row is sorted in non-decreasing order.
- The first integer of each row is greater than the last integer of the previous row.

Given an integer target, return true *if target is in matrix* or false *otherwise*.

You must write a solution in $O(\log(m * n))$ time complexity.

Example 1:

1	3	5	7
10	11	16	20
23	30	34	60

Input: matrix = $[[1,3,5,7],[10,11,16,20],[23,30,34,60]]$, target = 3

Output: true

💡 Question 3

Given an array of integers arr, return *true if and only if it is a valid mountain array*.

Recall that arr is a mountain array if and only if:

- $arr.length \geq 3$
- There exists some i with $0 < i < arr.length - 1$ such that:
 - $arr[0] < arr[1] < \dots < arr[i - 1] < arr[i]$
 - $arr[i] > arr[i + 1] > \dots > arr[arr.length - 1]$

Example 1:

Input: arr = $[2,1]$

Output:

false

💡 Question 4

Given a binary array nums, return *the maximum length of a contiguous subarray with an equal number of 0 and 1*.

Example 1:

Input: nums = $[0,1]$

Output: 2

Explanation:

$[0, 1]$ is the longest contiguous subarray with an equal number of 0 and 1.

💡 Question 5

The **product sum** of two equal-length arrays a and b is equal to the sum of $a[i] * b[i]$ for all $0 \leq i < a.length$ (**0-indexed**).

- For example, if $a = [1,2,3,4]$ and $b = [5,2,3,1]$, the **product sum** would be $1*5 + 2*2 + 3*3 + 4*1 = 22$.

Given two arrays nums1 and nums2 of length n , return *the minimum product sum if you are allowed to rearrange the order of the elements in nums1*.

Example 1:

Input: nums1 = $[5,3,4,2]$, nums2 = $[4,2,2,5]$

Output: 40

Explanation:

We can rearrange nums1 to become $[3,5,4,2]$. The product sum of $[3,5,4,2]$ and $[4,2,2,5]$ is $3*4 + 5*2 + 4*2 + 2*5 = 40$.

💡 Question 6

An integer array original is transformed into a **doubled array** changed by appending **twice the value** of every element in original, and then randomly **shuffling** the resulting array.

Given an array changed, return original *if changed is a doubled array*. If changed is *not a doubled array*, return an empty array. The elements in original may be returned in **any order**.

Example 1:

Input: changed = $[1,3,4,2,6,8]$

Output: $[1,3,4]$

Explanation: One possible original array could be $[1,3,4]$:

- Twice the value of 1 is $1 * 2 = 2$.
- Twice the value of 3 is $3 * 2 = 6$.
- Twice the value of 4 is $4 * 2 = 8$.

Other original arrays could be $[4,3,1]$ or $[3,1,4]$.

💡 Question 7

Given a positive integer n , generate an $n \times n$ matrix filled with elements from 1 to n^2 in spiral order.

Example 1:

Input: $n = 3$

Output: $[[1,2,3],[8,9,4],[7,6,5]]$

💡 Question 8

Given two sparse matrices mat1 of size $m \times k$ and mat2 of size $k \times n$, return the result of $mat1 \times mat2$. You may assume that multiplication is always possible.

Example 1:

Input: mat1 = $[[1,0,0],[-1,0,3]]$, mat2 = $[[7,0,0],[0,0,0],[0,0,1]]$

Output:

$[[7,0,0],[-7,0,3]]$
